

Consistently Delivering Development Teams that Produce Superior Results

Our approach to delivering superior results to clients starts with investing heavily in talent acquisition, training, and workforce development across the entire service value chain. Energetic and talented associates join teams of experts to take responsibility for well-defined tasks that match their skills – made possible by our IT Staff Transformation training program.

IT Staff Transformation Training

Recognizing the critical importance of a well-trained development team, we have developed a full curriculum of developer training. The training covers architecture, development standards, tools, process, and soft skills. As we add teams, even the most experienced developers are passed through this training to ensure that everyone is following the same roadmap. This training also ensures all employees are in unison when working on projects which will, in turn, increase the time-to-market. We also adapt our training to fit the client architecture and standards as needed.

“For every 10 Java development jobs available, there is only one qualified person to fill them. By using our intensive training program, QAT Global can provide clients with development teams with the advanced skills they so desperately need,” said QAT Global President Ken Bass.

Curriculum Overview

Common Core

- Communication tools
- Culture
- Languages – Java, .NET, NodeJS
- Scrum

Languages

Java

- Tools
- Coding Standards
- Naming Standards
- Unit Testing
- Frameworks
- Architecture

.Net

- Tools
- Coding Standards
- Naming Standards
- Unit Testing
- Architecture

NodeJS

- Tools
- Coding Standards
- Unit Testing
- Architecture

Training Formats

- Instructor-led
- Written curriculum
- Videos
- Exercises
- Mentors

Consistent, Reliable Code Quality

By having all of our development team members participate in our training program, we are able to ensure the architecture, development standards, tools and process are consistent from developer to developer and project to project. This ensures that your codebase can easily be updated, is structurally sound, and leverages best practices. This also allows you to easily add developers to your team since they will easily be able to come onto the project and quickly understand the code.

When you outsource with QAT Global, you have the security knowing all of your IT demands will be taken care of by experts with the same training, onshore or offshore, and the quality will meet your requirements.
